

A female manatee nurses her calf from a nipple located behind her flipper. A calf will remain dependent upon its mother for up to two years. Although the calf continues to nurse, it will begin eating its life-long diet of aquatic plants within just a few weeks after birth. This peaceful vegetarian's numbers have been greatly reduced, largely due to human activity and encroachment. By adopting an endangered manatee, you will help to support continued research and public awareness efforts. For more information, contact Save the Manatee® Club, 500 N. Maitland Ave., Suite 210, Maitland, FL 32751. 407-539-0990.

Dear Dr Henney,

I urge you to call
for an immediate ban
on agricultural use
of antimicrobials for
growth promotion if
they are also used
to treat humans.
